

# The Coda Terminal and the Future of Geologic CO<sub>2</sub> Storage via Rapid Mineralization

Kári Helgason, Head of Research & Innovation

BALTIC CARBON FORUM 2021

**Carbfix**

**Climate goals will not be met without widespread carbon capture and storage**

Emission reductions required by 2060  
IEA: Exploring Clean Energy pathways: The role of CO<sub>2</sub> storage 2019

Basalts and other reactive  
rock formations

+

CO<sub>2</sub> dissolved in water

=

Solid carbonates

**Carbfix**

Carbfix captures CO<sub>2</sub> and turns it into stone underground in under two years through proprietary technology that imitates and accelerates natural processes, providing a permanent and safe carbon storage solution.

Conventional  
injection of pure  
CO<sub>2</sub>

Carbfix injection  
of dissolved CO<sub>2</sub>

## Unique about mineral storage

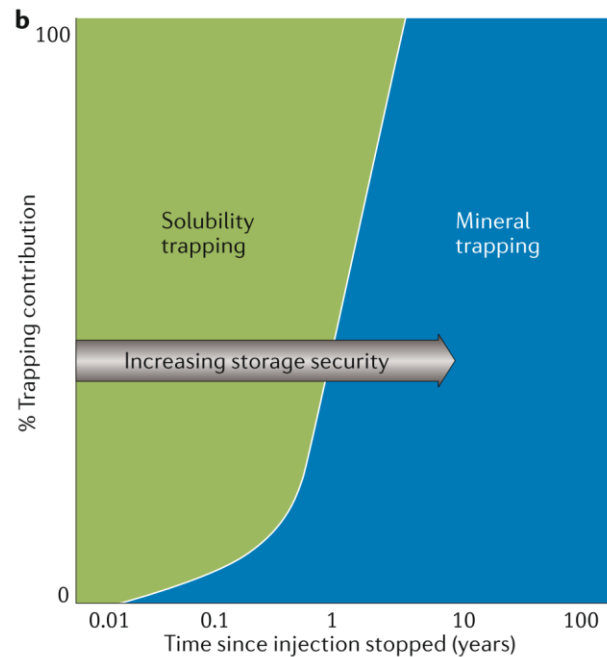

- **Safe:** risk of leakage is fully eliminated by dissolving CO<sub>2</sub> in water
- **Cheaper** than alternative solutions, lower up-front capital costs and risk
- **Environmentally friendly:** imitates and accelerates nature's way of storing CO<sub>2</sub> in rocks
- **Permanent:** minerals are stable for thousands of years limiting the need for long-term monitoring
- Built on firm **scientific foundation** and robust monitoring campaigns
- **Highly flexible** and modular with respect to capture technology, injection strategy and up-scaling
- High level of **public acceptance**

Unlocks large regions where CCS has not been considered possible

<https://www.carbfix.com/atlas>

## Project Silverstone

- Already injected >70 ktCO<sub>2</sub> since 2014
- Full scale (95%) capture and storage planned in 2025
- Selected as Innovation Fund small-scale project
- Design and construction of new CO<sub>2</sub> optimized capture plant
- Total cost 8 million EUR
- Expected to run the entire CCS chain at 27 EUR/tonne

Project  
Silverstone

## On-site capture and storage at industrial facilities

# First commercial direct air capture and storage chain

4000 tCO<sub>2</sub>/yr capacity

Injected to 400-2000m depth

Mineralization verified using chemical tracers

# CODA TERMINAL

A highly scalable, cost effective, CO<sub>2</sub> mineral storage hub

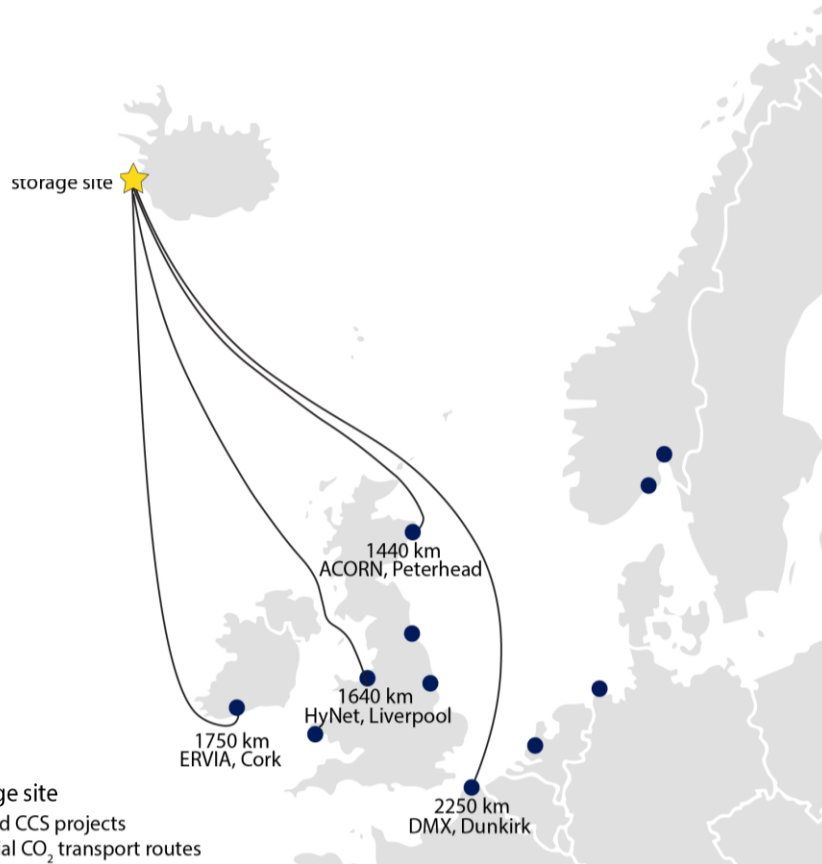

Low-cost storage makes longer transport leg feasible

Low energy requirements

Onshore multi-well operations lowers risks

ETS-deductible under the EU CCS directive adopted by the Icelandic parliament

★ storage site  
● Planned CCS projects  
— Potential CO<sub>2</sub> transport routes

# Storage site

EIA process started

Currently in FEED

Drilling starting in 2022

Full local support

Shipping partner is DanUnityCO<sub>2</sub> will commission and operate CO<sub>2</sub> carriers  
Low emission - methanol-fuelled

---

DAN-UNITY CO<sub>2</sub>

# Iceland storage capacity: ~2500 Gt

Iceland is almost entirely made out of volcanic basalt.

The youngest formations lie along the rift zone from SW to NE

These are the most permeable and chemically favourable

■ Young basaltic formations

★ Existing harbor facilities

★ The Coda Terminal

★ Hellisheidi geothermal power plant & Carbfix demonstration site

# Setting the stage for offshore mineralization

- The validation of using seawater instead of fresh water will unlock large regions in the world where water is a scarce resources
- Field scale injection of seawater-dissolved CO<sub>2</sub> in 2022
- CO<sub>2</sub> will be captured and transported from Switzerland.

An experimental study of basalt–seawater–CO<sub>2</sub> interaction at 130 °C
